

Safety checklist

☐ Keep kids and pets away from the cane toad

☐ Pick up the toad by its back legs, pointing its head away from you

☐ Wear a glove or put a plastic bag over the toad

☐ Wash your hands with soap afterwards

Poisons Information Line 13 11 26

Euthanasing cane toads – cooling and freezing

Cooling and freezing is the widely-used and preferred method for members of the public to kill cane toads. The following five steps are recommended:

- 1 Check the ID (see over the page for ID checklist) to ensure it is a cane toad, take a picture and text or email it to Parks and Wildlife to confirm the ID (see details below)
- 2 Place cane toads in a container, such as a plastic bag or container with a secure lid.
- 3 Put the container in a refrigerator for a minimum of four hours (this will anaesthetise the toads).
- 4 Put the container in a freezer until the toads are frozen solid (at least 24 hours).
- 5 Dispose of the container in your big green bin on bin day.

If plastic bags are used, toads should be wrapped first in paper to prevent their skin from freezing to cold surfaces.

Biodiversity facts

- Native species can be poisoned when they try to eat cane toads.
- Key species at risk include some snakes, goannas, bluetongue lizards, freshwater crocodiles and northern quolls.
- Cane toads have not caused any species to become extinct, but can significantly impact local populations.

What is being done?

Quarantine

- Cane toads have been known to hitch a ride on trucks, caravans, and other vehicles.
- Reggie, Parks and Wildlife's cane toad detector dog, is used to minimise the accidental transport of toads.
- Parks and Wildlife reminds all travellers leaving an area with cane toads to **'check their load for a toad.'**

Education

- Parks and Wildlife's education team visits schools to teach the community about cane toad identification, and the impact of cane toads on native species.
- Parks and Wildlife has released a cane toad teacher resource. **For more information visit dpaw.wa.gov.au/canetoads.**

Research and Collaboration

- Parks and Wildlife is working with Australian scientists to trial new ways of reducing the impact of cane toads on native species.
- Ongoing research is being carried out Australia-wide to develop new tools for managing cane toads.

Is it a cane toad?

As many native frogs can easily be mistaken for cane toads, it's important to know how to tell the difference.

To check:

- ☐ Is the skin dry and warty?
- ☐ Are there glands on the toad's shoulders?
- ☐ Is there an 'm'-shaped ridge on its nose?

Any toads found **outside the East Kimberley must be reported to Parks and Wildlife (see over the page). Do not kill these animals, a Parks and Wildlife officer will contact you with further directions.**

Native frogs commonly mistaken for cane toads

South west frogs

Heleioporus eyrei – moaning frog
